REC\_DS using C\_Week 7\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

## 1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

### **Input Format**

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

#### **Output Format**

If the given contact exists in the dictionary:

- 1. The first line prints "The given key is removed!" after removing it.
- 2. The next n 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

- 1. The first line prints "The given key is not found!".
- 2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

### Sample Test Case

```
Input: 3
Alice 1234567890
Bob 9876543210
Charlie 4567890123
Bob
```

Output: The given key is removed! Key: Alice; Value: 1234567890 Key: Charlie; Value: 4567890123

#### Answer

```
void insertKeyValuePair(Dictionary *dict, const char *key, const char *value) {
   if (dict->size == dict->capacity) {
      dict->capacity *= 2;
      dict->pairs = (KeyValuePair *)realloc(dict->pairs, dict->capacity *
   sizeof(KeyValuePair));
  }
```

```
240/01/180
      strcpy(dict->pairs[dict->size].key, key);
      strcpy(dict->pairs[dict->size].value, value);
      dict->size++;
    int doesKeyExist(Dictionary *dict, const char *key) {
      for (int i = 0; i < dict->size; i++) {
         if (strcmp(dict->pairs[i].key, key) == 0) {
           return 1:
      }
      return 0;
void removeKeyValuePair(Dictionary *dict, const char *key) {
      int found = 0;
      for (int i = 0; i < dict->size; i++) {
         if (strcmp(dict->pairs[i].key, key) == 0) {
           found = 1:
         if (found && i < dict->size - 1) {
           dict->pairs[i] = dict->pairs[i + 1];
      }
      if (found) {
        dict->size--;
    void printDictionary(Dictionary *dict) {
      for (int i = 0; i < dict->size; i++) {
         printf("Key: %s; Value: %s\n", dict->pairs[i].key, dict->pairs[i].value);
      }
    }
    Status: Correct
                                                                              Marks: 10/10
```
